The invention relates to a device for recognising a container by means of a marking provided on its surface. A problem associated with systems for recognising container markings is that the surface of the container or the marking may be irregular. In order to eliminate these problems, the invention uses a system comprising at least one imager (camera) and an arrangement of light sources and/or mirrors enabling the imager(s) to obtain two images from different directions relative to the marking.

After the amendments of the claims, wherein the invention has been clarified by specifying the angular conditions between the light sources and the imager(s) and the positions of the mirrors respectively, the documents cited in the International Search Report now only represent the general state of the art. The invention defined in claims 1-13 is therefore not disclosed by any of these documents.

The cited prior art does not give any indication that would lead a person skilled in the art to the claimed device for recognising a container. Therefore, the claimed invention is not obvious to a person skilled in the art.

Accordingly, the invention defined in claims 1-13 is novel and is considered to involve an inventive step. The invention is industrially applicable.
